ABSTRACT

The Online Banking System is a Java-based project designed to enhance the efficiency and security of remote banking transactions. Featuring robust user authentication, account management, and fund transfer capabilities, the system ensures a seamless and secure online banking experience. Utilizing Java's versatile technologies such as Servlets, JSP, and JDBC, the project prioritizes platform independence, scalability, and adherence to best coding practices. With a focus on user-centric design, real-time transaction processing, and stringent security measures, the Online Banking System caters to the evolving needs of modern banking, providing customers with a reliable, accessible, and intuitive platform for managing their financial activities from anywhere, while laying the groundwork for future technological advancements in the financial sector.
